

Hayward Gordon launches next generation ANSI pumps

Hayward Gordon is pleased to announce it's totally redesigned line of ANSI process pumps. The ANSI**Max** line has been updated to comply fully with the latest B73.1 standard and many additional features have been added. Cast steel is now the standard casing and impeller material with several alloy options available including 316 stainless steel, Alloy 20, and Cd4MCu. Reverse vane, balanced impellers provide repeatable performance throughout the life of the pump and the "micrometer-type" power frame adjustment allows for accurate setting of impeller clearance in seconds without the need for shims. For extended seal life, five engineered seal chamber options are now available for optimal matching to the seal and the application.
